SKILLS

Frontend

React, Next.js, TypeScript, Angular, RxJS, JavaScript, HTML5, CSS3, SASS, Tailwind CSS

Testing & CI/CD

Jest, Nx, Git, GitHub, Jenkins, Docker, Jira

Backend (production experience)

Java, Spring Boot, C#, .NET Core, REST APIs, SQL Server, RabbitMQ, Keycloak

Methodologies

Agile, Scrum

EDUCATION

Postgraduate, Full Stack Development

PUC-RS · 2023 — 2024

Bachelor's, Internet Systems

FIAP · 2021 — 2022

LANGUAGES

Portuguese: Native

English: Professional working proficiency

SUMMARY

Fullstack engineer with almost 5 years in fintech, shipping products end to end in TypeScript and Python on top of production backend experience in Java, Spring Boot, and .NET. Architected PicPay's config-driven fraud-analysis platform and built a LangGraph + Claude agent (FastAPI + Next.js) that triages chargeback disputes and drafts the rebuttal letter itself.

EXPERIENCE

Frontend Engineer — PicPay

Nov 2024 — Present

One of Brazil's largest digital banks, with 68M+ registered users and 44M+ active customers.

- Built and scaled HeroDash, PicPay's Angular monorepo of 66 feature modules shared by 10+ squads, since the platform's early days, spanning fraud prevention, chargeback, lending, cards, and insurance operations.
- Architected the config-driven fraud-analysis workspace, replacing separate per-product screens with a unified system of 4 analysis queues across 14+ financial products, with standardized case assignment, batch actions, and role-based permissions.
- Led the refactor from coupled legacy code to config-level queue delivery, cutting new-queue code by roughly 90 percent and enabling rapid delivery of MED, the Central Bank's mandatory Pix-refund queue.
- Founded and owned the dossier module end to end for over a year, automating legal-evidence compilation for fraud analysts with 7 reusable templates including a Pix-scam template, replacing manual collection across three data sources.

Frontend Developer (promoted from Intern) — Sinquia

Nov 2021 — Oct 2024

One of Brazil's largest financial software providers, serving banks and credit unions.

- Developed and maintained mission-critical PIX and SPB systems, Brazil's real-time payment infrastructure, building Angular screens for transaction processing, monitoring, and message reprocessing for banks with zero tolerance for downtime.
- Built RBAC and user administration features integrated with Keycloak, plus report generation with PDF, Excel, and CSV export.
- Integrated REST APIs and RabbitMQ-backed monitoring flows, collaborating daily with Java and C#/.NET backend teams in a multi-team agile environment.

PROJECTS

FinLivre — Local-First Personal Finance App

2026

Next.js 16 / React 19 / TypeScript app that imports bank statements (OFX, or photo/PDF via Claude Vision) and turns them into a categorized dashboard and 50/30/20 budget plan. All data stays client-side in IndexedDB (Dexie); no backend, no account. 224 Jest tests.

Dispute Triage Agent — Fullstack AI Agent for Chargeback Disputes

2026

LangGraph + Claude agent that triages card chargebacks: reasons over conflicting signals to recommend fight or accept, then drafts the representment letter itself when fighting, citing only evidence the merchant actually has. FastAPI backend, Next.js frontend, deployed as two independently running services with rate limiting and a real eval harness. Same fraud/chargeback domain as my PicPay work, approached here with an LLM agent instead of a rules engine.

VizinHelp — Full-Stack Platform (Postgraduate Thesis)

Dec 2023 — Jun 2024

Community platform connecting neighbors through skill-sharing. Built with Angular, Node.js, PostgreSQL, and Keycloak for identity and access management.
